# Pick up and Delivery TSP

# Pick up and Delivery TSP

# Solution Strategies – Single Vehicle Case

- Mixed Integer Programming Models (MILPs)
  - Traveling Salesman Problem (TSP)
  - Pick up and Delivery TSP (PDTSP)
  - PDTSP with Split Demand (PDTSPSD)
- Heuristic algorithms
  - Nearest Neighbor (TSP)
  - Extensions of Nearest Neighbor for PDTSP and PDTSPSD
- Metaheuristic algorithms
  - Greedy Randomized Adaptive Search Procedure (GRASP)
  - Path Relinking
  - Variable Neighborhood Descent (VND)
- Hybrid approaches (matheuristics)
  - MILP based local search operators
  - MILP based post-optimization procedures
  - PDTPSP decomposition

# A GRASP Algorithm

---

## Algorithm 1 GRASP

---

```
1:  $f^* \leftarrow \infty$ 
2: for  $i = 1$  to  $GRASPIterations$  do
3:    $S \leftarrow \text{GreedyRandomAlgorithm}()$ 
4:    $S \leftarrow \text{LocalSearch}(S)$ 
5:   if  $f(S) < f^*$  then
6:      $S^* \leftarrow S$ 
7:      $f^* \leftarrow f(S)$ 
8:   end if
9: end for
10: return  $S^*$ 
```

---

# Our GRASP Algorithm

---

## Algorithm 2 GRASP + VND

---

```
1:  $f^* \leftarrow \infty$ 
2: for  $i = 1$  to  $GRASPIterations$  do
3:    $S \leftarrow \text{GreedyRandomAlgorithm}()$ 
4:    $S \leftarrow \text{VND}(S)$ 
5:   if  $f(S) < f^*$  then
6:      $S^* \leftarrow S$ 
7:      $f^* \leftarrow f(S)$ 
8:   end if
9: end for
10: return  $S^*$ 
```

---

# VND Structure

Seven neighborhoods within a VND method

- Destroy and Repair
- 2-opt
- 3-opt
- Or-opt( $\lambda$ ),  $\lambda = 2, 3$
- Forward insertion
- Backward insertion

# Our GRASP Algorithm

---

## Algorithm 3 GRASP + VND

---

```
1:  $f^* \leftarrow \infty$ 
2: for  $i = 1$  to  $GRASPIterations$  do
3:    $S \leftarrow \text{GreedyRandomAlgorithm}()$ 
4:    $S \leftarrow \text{VND}(S)$ 
5:   if  $f(S) < f^*$  then
6:      $S^* \leftarrow S$ 
7:      $f^* \leftarrow f(S)$ 
8:   end if
9: end for
10: return  $S^*$ 
```

---

# Our GRASP Algorithm

---

## Algorithm 4 Greedy Random Algorithm

---

- 1:  $S \leftarrow \emptyset$
  - 2: Evaluate the incremental costs of the candidate elements
  - 3: **while**  $S$  is not a complete solution **do**
  - 4:     Build the restricted candidate list ( $RCL$ )
  - 5:     Select an element  $s$  from the  $RCL$  at random
  - 6:      $S \leftarrow S \cup \{s\}$
  - 7:     Reevaluate the incremental costs
  - 8: **end while**
  - 9: **return**  $S$
-

# Our GRASP Algorithm

Example of an unfeasible constructive solution

- Vehicle capacity ( $Q=10$ )

| <b>Station</b> | 1  | 2 | 3  | 4  | 5  | 6 | 7 | 8  | 9 | 10 | 11 | 12 | 13 | 14 |
|----------------|----|---|----|----|----|---|---|----|---|----|----|----|----|----|
| <b>Demand</b>  | 4  | 6 | -3 | -3 | -3 | 4 | 3 | -7 | 0 | 9  | -7 | 10 | -6 | -7 |
| <b>Load</b>    | 10 | 6 | 0  | 3  | 6  | 9 | 5 | 2  | 9 | 9  | 0  | 7  | -3 | 3  |

# Destroy and Repair Approach

Example of an infeasible constructive solution

- Vehicle capacity ( $Q=10$ )

| Station | 1  | 2 | 3  | 4  | 5  | 6 | 7 | 8  | 9 | 10 | 11 | 12 | 13 | 14 |
|---------|----|---|----|----|----|---|---|----|---|----|----|----|----|----|
| Demand  | 4  | 6 | -3 | -3 | -3 | 4 | 3 | -7 | 0 | 9  | -7 | 10 | -6 | -7 |
| Load    | 10 | 6 | 0  | 3  | 6  | 9 | 5 | 2  | 9 | 9  | 0  | 7  | -3 | 3  |

- Set of fixed ordered stations : Stations from 1 to 11
- Set of stations to remove and insert in a different position: Stations from 12 to 14

# Repairing an Unfeasible Solution – MILP

- Sets

- $\mathcal{N}$ : Set of stations
- $\mathcal{N}_s$ : Set of fixed ordered stations
- $\mathcal{N}_r$ : Set of stations to insert
- $\mathcal{A}$ : Set of arcs

- Parameters

- $c_{ij}$  : Cost of traveling from station  $i$  to station  $j$
- $q_i$  : Demand or slack of bicycles in station  $i$
- $Q$  : Vehicle capacity

- Decision Variables

- $s$ : Surplus of bikes in the solution
- $y_{ij} = \begin{cases} 1 & \text{if arc } (i,j) \text{ is used in the solution} \\ 0 & \text{otherwise} \end{cases}$
- $x_{ij} = \begin{cases} 1 & \text{if station } i \text{ is visited anytime before station } j \\ 0 & \text{otherwise} \end{cases}$
- $l_i$  : Load of the vehicle after visiting  $i^{th}$  station
- $l^+, l^-$  : Maximum and minimum load in the solution

# Repairing an Unfeasible Solution – MILP

$$\min f = s \quad (1)$$

subject to,

$$x_{0i} = 1 \quad \forall i \in \mathcal{N} \setminus \{0\} \quad (2)$$

$$x_{ij} + x_{ji} = 1 \quad \forall (i, j) \in \mathcal{A} \quad (3)$$

$$y_{ij} \leq x_{ij} \quad \forall (i, j) \in \mathcal{A} \quad (4)$$

$$x_{ij} = 1 \quad \forall i \in \mathcal{N}_f, j \in \mathcal{N}_f, j > i \quad (5)$$

$$\sum_{j \in \mathcal{N}} y_{ij} = 1 \quad \forall i \in \mathcal{N} \quad (6)$$

$$y_{i,i+1} + \sum_{j \in \mathcal{N}_r} y_{ij} = 1 \quad \forall i \in \mathcal{N}_f \quad (7)$$

## Repairing an Unfeasible Solution – MILP

$$\sum_{j \in \mathcal{N}} y_{ij} - \sum_{j \in \mathcal{N}} y_{ji} = 0 \quad \forall i \in \mathcal{N} \quad (8)$$

$$l_j \geq l_i - q_j - 2Q(1 - y_{ij}) \quad \forall (i, j) \in \mathcal{A} \quad (9)$$

$$l^+ \geq l_i \quad \forall i \in \mathcal{N} \quad (10)$$

$$l^- \leq l_i \quad \forall i \in \mathcal{N} \quad (11)$$

$$l^+ - l^- = Q + s \quad (12)$$

$$y_{ij} \in \{0, 1\} \quad \forall i \in \mathcal{N}, j \in \mathcal{N} \quad (13)$$

$$x_{ij} \in \{0, 1\} \quad \forall i \in \mathcal{N}, j \in \mathcal{N} \quad (14)$$

$$l_i \geq 0 \quad \forall i \in \mathcal{N} \quad (15)$$

$$l^+, l^- \geq 0 \quad (16)$$

# Speeding up MILP Performance

- Time limit
- Objective bound to stop optimization

The screenshot shows the Gurobi Optimization website with a dark header bar. The header includes the Gurobi logo (a red cube), the text "GUROBI OPTIMIZATION", and navigation links for PRODUCTS, DOWNLOADS, RESOURCES, ACADEMIA, SUPPORT, and ABOUT. There is also a search bar labeled "Enter search term" and a language selection bar with icons for English, German, French, and Spanish. On the right, there are "Login" and "Register" buttons.

The main content area has a breadcrumb navigation: Home > Documentation > BestBdStop. Above the parameter description, there are links to "Next: BestObjStop", "Up: Parameter Descriptions", and "Previous: BarkerLimit".

**First, set the following:**

**Version:** 8.0

**Languages:**

- C       C++
- Java       .NET
- Python       MATLAB
- R

**BestBdStop**

Objective bound to stop optimization

|                       |           |
|-----------------------|-----------|
| <b>Type:</b>          | double    |
| <b>Default value:</b> | Infinity  |
| <b>Minimum value:</b> | -Infinity |
| <b>Maximum value:</b> | Infinity  |

Terminates as soon as the engine determines that the best bound on the objective value is at least as good as the specified value. Optimization returns with an `USER_OBJ_LIMIT` status in this case.

Note that you should always include a small tolerance in this value. Without this, a bound that satisfies the intended termination criterion may not actually lead to termination due to numerical round-off in the bound.

**Note:** Only affects mixed integer programming (MIP) models

For examples of how to query or modify parameter values from our different APIs, refer to our [Parameter Examples](#).

# An Hybrid Constructive Phase

---

**Algorithm 5** GRASP + VND

---

```
1: c  $\leftarrow \infty$ 
2:  $f^* \leftarrow \infty$ 
3: for  $i = 1$  to GRASPIterations do
4:    $S \leftarrow \text{GreedyRandomAlgorithm}(c)$ 
5:    $S \leftarrow \text{VND}(S)$ 
6:   if  $f(S) < f^*$  then
7:      $S^* \leftarrow S$ 
8:      $f^* \leftarrow f(S)$ 
9:   end if
10: end for
11: return  $S^*$ 
```

---

# An Hybrid Constructive Phase

---

## Algorithm 6 Greedy Random Algorithm

---

```
1:  $S \leftarrow \text{GreedyRandomAlgorithm}()$ 
2: while  $S$  is unfeasible do
3:   if  $f(S) < c$  then
4:     Solve RepairMILP( $S$ )
5:   else
6:      $S \leftarrow \text{GreedyRandomAlgorithm}()$ 
7:   end if
8: end while
9: if  $c > f(S)$  then
10:    $c = f(S)$ 
11: end if
12: return  $S^*, c$ 
```

---

# Preliminary Results

## Data sets and software

- Dataset
  - Instances taken from:  
<https://hhperez.webs.ull.es/PDssite/index.html>
  - Instances with 20, 30, 50, 100 nodes were tested
- Software
  - All the algorithms were implemented on C++ (Visual Studio)
  - Mathematical models were solved using Gurobi Optimizer 7.5
- Computer features
  - Intel core i7, 8Gb RAM.
  - OS: Windows 10 (x86-64)

# Preliminary Results – MILP-based Constructive Algorithm

| $N$ | Original constructive algorithm |              |           |              |                         | Repair constructive algorithm - MILP |              |           |                     |                         |        |
|-----|---------------------------------|--------------|-----------|--------------|-------------------------|--------------------------------------|--------------|-----------|---------------------|-------------------------|--------|

# Current and Future Work

- Improve the performance of destroy strategy finding a different criterion to remove stations.
- Solve larger instances of the PDTSP via GRASP+VND and compare our results with reported benchmarks.
- Extend our solutions algorithms to the multiple vehicle case.
